

MATTRESS ADJUSTING SYSTEM

ABSTRACT

A mattress adjusting system includes an inflatable air mattress having front and rear portions removably positionable between a mattress and a box spring. The air mattress includes a cavity for receiving air therein and for causing a bed mattress to tilt upwardly at the front portion thereof. The system further includes a pump mechanism for selectively inflating and deflating the air mattress and a weight member attached within the air mattress for assisting to deflate same. The pump mechanism includes a control panel with a plurality of control buttons for causing air to selectively enter and exit the air mattress and a release valve for allowing an operator to manually deflate the mattress in the event of a power outage.
